

Manufacturing Services

JH Robotics Contract Manufacturing capabilities range from piece part manufacturing to full product build and test. We can manufacture the parts, assemble the piece parts, inspect, test and package the product for shipment. We feature fourteen (14) CNC Lathes (3 with MTL's for lights out operation) and eight (8) Vertical Machining Centers, as well as a broad range of equipment for secondary operations. Our material capability expertise includes aluminum, plastic, steel, and stainless steel.

Throughout the component manufacturing process quality assurance is first and foremost. Our machine operators and Quality Control department are integral parts of our quality assurance program. Parts are inspected by the QC department at machine setup, in process and a random ten (10) percent (100 % upon customer request) inspection from each lot prior to shipment. A First Article Inspection report is provided with all new parts and SPC capabilities are available upon request for high volume orders.

We maintain a rigorous inspection equipment calibration program.

At JH Robotics we are committed to on time deliveries and the highest quality products. We have the capabilities to be your dock to stock supplier or provide Just-In-Time deliveries all with our guaranteed 48 hour quote turnaround time.
